I. News & Views

Is Resurgence in Milk Sharing Safe?

Wet nursing was considered the safest and most popular alternative form of nutrition until further options were invented, leading to the eventual decline in the profession. Now, society is seeing a resurgence in milk sharing practices through women with an oversupply who are storing extra breast milk and selling it. Unlike wet nursing, however, these interactions often take place away from the regulations and medical examinations that once kept this practice relatively safe.

Have you checked out the new BFI Strategy for Ontario’s Crib Cards yet? These tiny, foldable cards are a keepsake for families and a teaching aid for providers. The six panel card is gender neutral, and replaces formula-sponsored cards. It uses simple language with illustrations on key aspects of BFI-related postpartum care to all families regardless of their infant-feeding decision. Hospitals can personalize it by adding a label with local supports.

Access them here.
Health Canada Says it Will Set Limit on Arsenic in Food — Including Baby Cereal

Currently, there is no hard limit on arsenic in rice-based food in Canada and the U.S., despite existing regulations in Europe. Although the toxicity of arsenic depends on its chemical form and level of exposure, the naturally occurring element can cause various health issues including skin lesions, nausea and diarrhea, with long-term exposure associated with an increased risk of cancer. Health Canada says it will launch a months-long consultation process this year on setting a maximum level of arsenic allowed in rice and rice-based food, including baby cereal. A proposal for these new measures should be available for consultation with the food industry, professional organizations and consumers by mid-2019.

Opinion: Shouting ‘Self-Care’ at People Who Actually Need Community Care Is How We Fail People

Self-care is about the individual caring for their own basic physical needs, whereas community care is focused on the collective: taking care of people together, for everything from basic physical needs to psychological and even spiritual ones. Women of colour in particular have been calling for a shift to community care for years, and yet the onslaught of the self-care industry continues. Especially now, in a world full of increasingly violent rhetoric and acts, community care becomes essential. Unlike self-care, this response isn’t about a bandage solution: It’s about healing wounds together and eliminating the hazards that caused them together, too.

II. Recent Reports & Research - Maternal and Child Health

Systematic Review of the Effects of Skin-to-Skin Care on Short-Term Physiologic Stress Outcomes in Preterm Infants in the Neonatal Intensive Care Unit

Infants in the neonatal intensive care unit (NICU) are exposed to many stressors. There is growing evidence that chronic stress early in life has long-term neurodevelopmental implications. Skin-to-skin care (SSC) is an intervention used to reduce stress in the NICU. In premature infants in the NICU, what is the available evidence that SSC improves short-term physiologic stress outcomes compared with incubator care? Although there have been some mixed findings, the research supports that SSC improves short-term cardiorespiratory stress outcomes compared with incubator care. The evidence is clearer for studies reporting stress hormone outcomes, with strong evidence that SSC reduces cortisol and increases oxytocin levels in preterm infants. This suggests that SSC is safe and has stress-reducing benefits. SSC should be considered an essential component to providing optimal care in the NICU.

Access the article and read the discussion.
Infant Deaths in Sitting Devices

Annually, several hundred infant deaths occur in sitting devices, especially car safety seats [CSSs] and strollers. Although guidelines discourage routine sleeping in sitting devices, little is known about factors associated with deaths in sitting devices. To remedy this, the 2004–2014 National Center for Fatality Review and Prevention data was analyzed. Of 11,779 infant sleep-related deaths, 348 (3.0%) occurred in sitting devices. Of deaths in sitting devices, 62.9% were in CSSs, and in these cases, the CSS was used as directed in <10%. Among all sitting-device deaths, 81.9% had ≥1 risk factor, and 54.9% had ≥2 risk factors. More than half (51.6%) of deaths in CSSs were at the child’s home. Compared with other deaths, deaths in sitting devices had higher odds of occurring under the supervision of a child care provider or baby-sitter compared with a parent. In conclusion, there seems to be higher odds of sleep-related infant death in sitting devices when a child care provider or baby-sitter is the primary supervisor. Using CSSs for sleep in nontraveling contexts may pose a risk to the infant.

A Parent-Targeted and Mediated Video Intervention to Improve Uptake of Pain Treatment for Infants During Newborn Screening: A Pilot Randomized Controlled Trial

Most newborns undergo newborn screening blood tests. Breastfeeding, skin-to-skin care, and sweet solutions effectively reduce pain; however, these strategies are inconsistently used. A 2-armed pilot randomized controlled trial was conducted in a mother-baby unit to examine the feasibility and acceptability of a parent-targeted and -mediated video demonstrating use of these pain-reducing strategies and to obtain preliminary effectiveness data on uptake of pain management. One hundred parent-newborn dyads were randomized to view the video or receive usual care (51 intervention and 49 control arm). Consent and attrition rates were 70% and 1%, respectively. All participants in the intervention arm received the intervention as planned and reported an intention to recommend the video and to use at least 1 pain treatment with breastfeeding or skin-to-skin care preferred over sucrose. In the intervention arm, 60% of newborns received at least 1 pain treatment compared with 67% in the control arm. The video was well accepted and feasible to show to parents. As there was no evidence of effect on the use of pain management, major modifications are required before launching a full-scale trial. Effective means to translate evidence-based pain knowledge is warranted.

Milk Therapy: Unexpected Uses for Human Breast Milk

Human breast milk provides a child with complete nutrition but is also a popular therapeutic remedy that has been used in traditional, natural pharmacopeia, and ethnomedicine for many years. The aim of this current review is to summarize studies of non-nutritional uses of mothers’ milk. Two databases (PubMed and Google Scholar) were searched with a combination of twelve search terms. Fifteen studies were included in the systematic review. Ten of these were randomized controlled trials, one was a quasi-experimental study, two were in vitro studies, and four employed an animal research model. Many human milk components have shown promise in preclinical studies and are undergoing active clinical evaluation. The protective and treatment role of fresh breast milk is particularly important in areas where mothers and infants do not have ready access to medicine.

Access the article.
Breastfeeding Intensity and Exclusivity of Early Term Infants at Birth and 1 Month

To examine breastfeeding exclusivity and intensity of early term (ET) infants, born at 37–38 weeks, and term infants, born at 39–41 weeks, during the postpartum hospitalization and the first month of life, a prospective cohort study of 358 mothers of ET and term infants was studied during the first 72 hours after birth and at 1 month of age. ET infants had significantly lower breastfeeding in the first hour, lower exclusive breastfeeding in the hospital and at 1 month, and lower rates of high breastfeeding intensity in the hospital and at 1 month, after controlling for confounding variables. ET infants had more emergency room (ER) visits in the first month, and all ET infants who had ER visits were exclusively breastfed. In conclusion, ET infants had lower breastfeeding in the hospital and at 1 month. They should be regarded as a group at risk for breastfeeding challenges and infant morbidity.

Access the article and read the discussion.

Best Start can help you reverse this trend:

Refer new parents of ET infants to our Breastfeeding Preterm Infants booklets! They are available in English, French and 16 other languages!

Association of Full Breastfeeding Duration with Postpartum Weight Retention in a Cohort of Predominantly Breastfeeding Women

Full breastfeeding (FBF) is promoted as effective for losing pregnancy weight during the postpartum period. This study evaluated whether longer FBF is associated with lower maternal postpartum weight retention (PPWR) as compared to a shorter FBF duration. The MILK (Mothers and Infants Linked for Healthy Growth) study is an ongoing prospective cohort of 370 mother–infant dyads, all of whom fully breastfed their infants for at least 1 month. Breastfeeding status was subsequently self-reported by mothers at 3 and 6 months postpartum. Maternal PPWR was calculated as maternal weight measured at 1, 3, and 6 months postpartum minus maternal prepregnancy weight. Using linear mixed effects models, by 6 months postpartum, adjusted means ± standard errors for weight retention among mothers who fully breastfed for 1–3, 3–6, and ≥6 months (0.97 ± 0.32 kg) were estimated. Compared to mothers who reported FBF for 1–3 months, those who reported FBF for 3–6 months and ≥6 months both had lower PPWR over the period from 1 to 6 months postpartum. However, PPWR from 3 to 6 months was not significantly different among those who reported FBF for 3–6 versus ≥6 months. Interventions to promote FBF past 3 months may increase the likelihood of postpartum return to prepregnancy weight.

Association between Characteristics at Birth, Breastfeeding and Obesity in 22 Countries: The WHO European Childhood Obesity Surveillance Initiative

Breastfeeding has been described as a protective factor, and the more exclusively and the longer children are breastfed, the greater their protection from obesity. Birth weight has been shown to have a positive association with later risk for obesity. It was the aim of this paper to investigate the association of breastfeeding, exclusive breastfeeding and birth weight, with obesity among children. Data from 22 European countries were collected using cross-sectional, nationally representative samples of 6- to 9-year-
olds (n = 100,583). Information on the children’s birth weight and breastfeeding practice and duration was collected through a family record form. The pooled analysis showed that, compared to children who were breastfed for at least 6 months, the odds of being obese were higher among children never breastfed or breastfed for a shorter period, both in case of general and exclusive breastfeeding. Higher birth weight was associated with a higher risk of being overweight, which was reported in 11 out of the 22 countries. Children who were preterm at birth had higher odds of being obese, compared to children who were full-term babies. The present work confirms the beneficial effect of breastfeeding against obesity, which was highly increased if children had never been breastfed or had been breastfed for a shorter period.

The Effects of Kangaroo Mother Care on the Time to Breastfeeding Initiation Among Preterm and LBW Infants: A Meta-Analysis of Published Studies

Kangaroo mother care is a comprehensive intervention given for all newborns especially for premature and low birthweight infants. Even though time to initiating breastfeeding has been examined by randomized controlled trials, varying findings have been reported. Therefore, the main objective of this meta-analysis was to estimate the pooled mean time to initiate breastfeeding among preterm and low birthweight infants with or without kangaroo mother care intervention. The authors searched for randomized controlled trial studies conducted on the effects of kangaroo mother care on the time to breastfeeding initiation among preterm and low birthweight infants. A total of 467 eligible titles were identified and eight studies met the inclusion criteria. In this meta-analysis, the overall pooled mean time to initiate breastfeeding was 2.6 days. Preterm and low birthweight infants receiving kangaroo mother care intervention initiated breastfeeding 2 days 14 h 24 min earlier than conventional care of radiant warmer/incubator method. Kangaroo mother care promotes early initiation of breastfeeding as compared to conventional care method. Therefore, health facilities need to implement the kangaroo mother care for preterm and low birthweight infants.

Breastfeeding in Infancy and Lipid Profile in Adolescence

Breast milk has higher cholesterol than formula. Infants who are breastfed have different cholesterol synthesis and metabolism in infancy than infants who are formula fed. Little is known as to whether breastfeeding is associated with subsequent lipid profile, independent of adiposity. We assessed the association of breastfeeding in early infancy with lipid profile and adiposity at ∼17.5 years in a setting where exclusive breastfeeding is not associated with higher socioeconomic position. The study involved 3261 participants in the Hong Kong Chinese birth cohort Children of 1997, adjusting for sex, birth weight, gestational weeks, parity, pregnancy characteristics, parents’ highest education, mother’s place of birth, and age at follow-up. Exclusive breastfeeding, but not mixed feeding at 0 to 3 months, compared with formula feeding was associated with lower total cholesterol and low-density lipoprotein cholesterol but not with high-density lipoprotein cholesterol at ∼17.5 years. BMI and fat percentage measured by bioimpedance did not differ by type of infant feeding. Exclusive breastfeeding in early infancy may promote a healthier lipid profile in late adolescence through mechanisms unrelated to adiposity, implicating its potential long-term benefits for cardiovascular health.

Loneliness and Social Isolation are Public Health Issues

Loneliness and social isolation are now being recognized as public health issues in Ontario. Ontario’s Chief Medical Officer, Dr. David Williams, released his annual report in February 2019 called *Connected Community Healthier together*. The report highlights the growing evidence that loneliness and social isolation affects our health. A key takeaway from the report is that increasing connectedness and sense of belonging is a complex community issue. It requires organizations, groups, governments and citizens to work together. No one sector working alone can effectively address complex community issues.

Maternal, Infant and Childhood Risks Associated with Advanced Paternal Age: The Need for Comprehensive Counseling for Men

While there has been extensive research regarding infertility and comorbidities in the aging mother, relatively few studies have explored similar reproductive factors in aging men. However, evidence does suggest a decrease in fertility and an increase in pregnancy complications such as gestational diabetes, intrauterine growth restriction and preterm birth. Additionally, the offspring of fathers of APA have increased risks of chromosomal and non-chromosomal birth defects and an increased incidence of childhood autism and cancers. This review explores the data, with the intent that key counseling points, including the suggestion of sperm banking, can be highlighted when advising the midlife and older man who is considering paternity.

Access the article and read the discussion.

Genetic and Epigenetic Perspectives on the Role of Fathers in Fetal Alcohol Spectrum Disorder

Given that fathers who consume alcohol at risky levels may contribute to FASD due to sperm abnormalities and genetic and epigenetic influences, it is recommended that fathers as well as mothers be involved in pregnancy planning and in reducing/stopping at-risk alcohol consumption in the preconception period. Preconception interventions with male partners should be synchronized with those designed to support women in preventing FASD.

Polygenic Prediction of Weight and Obesity Trajectories from Birth to Adulthood

Although often attributed to unhealthy lifestyle choices or environmental factors, obesity is known to be heritable and highly polygenic; the majority of inherited susceptibility is related to the cumulative effect of many common DNA variants. Here we derive and validate a new polygenic predictor comprised of 2.1 million common variants to quantify this susceptibility and test this predictor in more than 300,000 individuals ranging from middle age to birth. Among middle-aged adults, we observe a 13-kg gradient in weight and a 25-fold gradient in risk of severe obesity across polygenic score deciles. In a longitudinal birth cohort, we note minimal differences in birthweight across score deciles, but a significant gradient emerged in early childhood and reached 12 kg by 18 years of age. This new approach to quantify inherited susceptibility to obesity affords new opportunities for clinical prevention and mechanistic assessment.

III. Current Initiatives

Canada’s “Recycling Exemption” in POPs Treaty Leads to Toxic Flame Retardants in Toys and Consumer Products

Allied with international NGO partners, the Canadian Environmental Law Association (CELA) has written to the federal government urging an immediate end to Canada’s “recycling exemption” in an international treaty on toxics. The exemption under the Stockholm Convention on Persistent Organic Pollutants (POPs) allows plastic consumer products containing toxic substances on the Canadian market, as confirmed by tests on multiple products. Canada is one of the few countries with a recycling exemption for polybrominated diphenyl ethers (PBDEs), flame retardant chemicals banned in multiple countries, including Canada, and added to the POPs treaty in 2004. The exemption allows plastic materials into the recycling stream until 2030. The resulting contamination allows these banned chemicals in products made from recycled plastic, posing a threat to public health, especially to children and fetuses, in utero.

Searching for an Inuk Role Model to End Violence Against Women

The Pauktuutit Inuit Women of Canada are on the search for an Inuk to be a role model for others in their community. The group’s violence and prevention department announced its national role model campaign on March 22 as part of its Pilimmaksarniq project. It’s an important issue for Inuit communities in Canada. Indigenous women and girls experience violence at a much higher rate than that of other women in Canada, and many communities in remote and northern areas of the country lack shelters and victim services. In 2017, the Pauktuutit Inuit Women of Canada received $900,000 in funding from the federal government for the Pilimmaksarniq project. Now they’re encouraging people to nominate Inuit who demonstrate healthy
relationships, gender equality and violence-free living, the group said in a release

Integrating Legal Services with Primary Care

Patients often leave a medical clinic with the same social and economic problems that caused them to need care in the first place. Providing legal services in health care settings can help address upstream factors that contribute to poor health. Social factors contributing to poor health often overlap with specific legal needs, particularly relating to income security, insurance, housing, employment, and legal status. The Health Justice Program (HJP) aims to bridge the gap between social determinants of health knowledge and practice through a multi-partner medical-legal program informed by the Medico Legal Partnership (MLP) model.

**OMSSA Webinar: Understanding and Preventing Burnout**

Burnout is an epidemic in the workforce. With ever increasing expectations for productivity, reductions in funding, increasing caseloads, and the expectation to do more with less time, staff in social services are finding themselves struggling to find the energy to provide the empathy, caring, and understanding required to support their clients. These webinars by the Ontario Municipal Social Services Association (OMSSA), taking place at 12:30pm on June 5 and October 9, 2019, will teach participants about burnout, the impact of burnout on our day-to-day performance, and how to bolster our resiliency so we can come back from burnout or prevent burnout altogether.

Learn more.

**OMSSA’s Mental Health Forum**

On June 13-14, 2019 in Toronto, the Ontario Municipal Social Services Association (OMSSA) will be hosting a two-day, cross-sectoral forum that highlights best practices leading to positive outcomes, and equips managers and frontline staff with the
knowledge, skills, and confidence to navigate a system in flux and assist individuals living with mental illness and addiction in ways that help unlock their potential.

**NUTRITION AND HEALTH STATUS OF NEW CANADIANS: READINESS FOR CULTURALLY APPROPRIATE CARE**

**Conference on Nutrition and Health Status of New Canadians**

*Nutrition and Health Status of New Canadians; Readiness for Culturally Appropriate Care* is a one day thematic conference that will take place on June 13, 2019. This thematic conference will provide participants with an overview of nutritional health, food security, and access to healthcare as basic rights of recent immigrants and refugees. This conference will provide an update on food security status of current refugees, as well as their nutritional status in Canada and in a global perspective by bringing together academic researchers, dietitians and settlement agencies to provide a comprehensive picture. The overarching goal is to engage the audience in discussion and hear their perspectives on the challenges and opportunities regarding food security, nutritional health and access to healthcare services.

Learn more.

---

**The Guelph Sexuality Conference**

The Guelph Sexuality Conference taking place in Guelph on June 20-21, 2019, is recognized as Canada's leading, annual training and education forum for sexual health professionals. You will hear a lot from new and experienced people in our field, sharing information and resources. Join other professionals, practitioners and researchers including medical and public health professionals, community service providers, health and sexuality educators, teachers, therapists, counselors, and clergy (just to name a few).

**Cultural Awareness Training Sessions**

Offered by Nogojiwanong Friendship Centre in Peterborough, the CAT (Cultural Awareness Training) sessions are meant to provide an awareness about Indigenous people in Canada.
Participants will have the opportunity to increase their knowledge, skills of the history, experiences, and events which have influenced the relationship of Indigenous people in Canada. The Indigenous population in Canada is the fastest growing population, the youngest, but also the most overrepresented population in the justice and child welfare systems. The goal of this workshop is to develop a knowledge base on Indigenous lived experiences and be able to support those individuals who are seeking your help and/or support. Many dates are offered between June 25, 2019 and March 31, 2020.

Learn more and register.

Would you like to build up on this?

Have a look at our manuals and ready-to-use workshops intended for Indigenous communities. See for example:
