

The MNCHP Bulletin is an electronic bulletin that highlights current trends, new resources and initiatives, upcoming events and more in the preconception, prenatal and early childhood education and development fields. Our primary focus is the province of Ontario, Canada but the bulletin also includes news and resources from around the world. Wherever possible, we include resources that are available for free.

**Please note that Best Start does not endorse or recommend any events, training, resources, services, research or publications of other organizations.*

I. News & Views

The Lancet: Canada Needs Universal Pharmacare

Canada's often-lauded health-care system has an unusual and unfortunate distinction. Physician care and hospital stays are universally publicly funded, but medicines are not. Canada is the only country in the world with public health care and no universal public system for providing prescription drugs (pharmacare).

[Learn more.](#)

Lived Experience: Breaking Down the Barriers Indigenous People Face in Canada's Health-Care System

"I personally believe many people have to connect more with indigenous people. Learn the real history of Canada and North America, learn what these people have gone through, and try and understand where they are at the current time. And as a non-indigenous person, look at the myths out there. Try to educate yourself and try to understand another culture."

[Learn more.](#)

CAMH Experts Discuss the Impact of Alcohol Policy on Women's Health

[Canadian Addiction and Mental Health](#) (CAMH) marked the publication of its [new Alcohol Policy Framework](#) with a discussion among leading CAMH experts on the unique impact alcohol policy has on women's health and safety. While men have historically been more likely than women to drink, this gap has been narrowing. Of particular concern to CAMH experts:

- Different health harms for women associated with alcohol.
- The rise in daily consumption of alcohol by women.
- The increased availability of alcohol.
- Targeted marketing of alcohol to women.
- The relationship between alcohol and violence against women.

[Learn more.](#)

And remember: The safest option is no alcohol at any time before and during pregnancy!

Visit and refer future parents to the bilingual website alcoholfreepregnancy.ca to learn more.

Opinion: If We're Serious About Getting More Women in Executive Roles, a Universal Childcare System Is Crucial

When the budget breaks, or childcare is simply unavailable, women are overwhelmingly the ones picking up the slack by reducing their hours or leaving the work force altogether. Nine out of 10 stay-at-home parents are women. And much of Canada's pay gap is attributed to the fact that women are more likely to work part-time. Indeed, when you account for both full- and part-time work, women make only 69 cents for every dollar men earn.

[Learn more.](#)

New All Nations Room at West Coast General Hospital Provides a Culturally Safe Space

The All Nations Room is a culturally-safe space inside West Coast General Hospital that is welcoming to Indigenous patients and their families, and where families can gather to share traditional healing practices and ceremonies, such as prayer and ritual cleansing. The space in the hospital in Port Alberni is a result of a partnership between First Nations, the First Nations Health Authority, and Island Health. Are you aware of such rooms in Ontario?

II. Recent Reports & Research

Prevalence and Predictors of Everyday Discrimination in Canada: Findings from the Canadian Community Health Survey

National research on discrimination in Canada has been slim. Discrimination impacts many areas of life including health, social and economic participation. This paper reports the prevalence of everyday discrimination experienced by Canadians and uses multivariate regression analysis to explore its socio-demographic and health related predictors. The implications of these findings for social policy are discussed.

[Access the report.](#)

Guidelines for Breastfeeding Infants with Cleft Lip, Cleft Palate, or Cleft Lip and Palate

In general, infants with cleft lip (CP) or cleft lip and palate (CLP) have difficulty creating suction and negative pressure because the oral cavity cannot be adequately separated from the nasal cavity during feeding. For these infants, negative consequences may include fatigue during breastfeeding, prolonged feeding times, nasal regurgitation, reflux, insufficient milk transfer, and impaired growth and nutrition. The literature describing breastfeeding outcomes in infants with CL/P is limited. Available evidence is anecdotal and sometimes contradictory, making it challenging to develop appropriate recommendations. This article from the Academy of Breastfeeding Medicine outlines recommendations and details answers to frequently asked questions.

[Access the article.](#)

Nipple Shield Use in Preterm Infants: Prevalence, Motives for Use and Association with Exclusive Breastfeeding-Results from a National Cohort Study

The aim of this study was to determine the prevalence of nipple shield use, explore the motives for nipple shield use and elucidate the association with exclusive breastfeeding in preterm infants. Data on nipple shield use was available for 1407 infants. Nipple shields were used by 54% of the mother-infant dyads and was more often related to breastfeeding problems associated with the infant than with the mother. The most common motive for nipple shield use was "infant slipped the nipple" (52%). The lower the gestational age, the more frequently nipple shields were used for motives related to the infant. For those using a nipple shield, only the motive "infant fell asleep at the breast" was associated with a higher risk of not breastfeeding exclusively at discharge, and "breast too engorged" with a lower risk of not breastfeeding exclusively, but overall nipple shield use was associated with failure of exclusive breastfeeding.

[Access the article.](#)

Exposures Through Breast Milk: An Analysis of Exposure and Information Calls to U.S. Poison Centers, 2001-2017

Authors analyzed US National Poison Data System calls between 2001 and 2017 with "Exposure through breast milk" or "Drug use during breastfeeding" as the coded scenario. Exposure calls that reported major effects involved opioids, benzodiazepines, ethanol, cyclobenzaprine, insulin, and amphetamines. Exposure calls most commonly involved antibiotics, antifungals, benzodiazepines, opioids, and selective serotonin reuptake inhibitors (SSRIs). Information calls most commonly involved systemic antibiotics, SSRIs, antihistamines, corticosteroids, and benzodiazepines. Most cases of severe toxicity included potential

exposures through breast milk to benzodiazepines and opioids.

[Access the article.](#)

Speaking of exposure...

[Watch the recording of How to talk about environmental safety in prenatal classes](#) to learn more about exposure during pregnancy.

Interventions to Support Women Who Are Overweight or Obese to Start and Continue Breastfeeding

Women who are overweight or obese can experience challenges with breastfeeding that could be overcome with additional encouragement and support. To find out what types of support are provided and what works best, authors identified seven randomised controlled trials (RCTs) involving 831 women, conducted in high-income countries between 2006 and 2015. Unfortunately, the methods used by the available trials varied in quality, with small numbers of participants, and no trial compared one type of support to another. Therefore, the effectiveness of interventions for supporting women who are overweight or obese to start and continue breastfeeding remains unclear.

SOGC Guidelin - Pregnancy and Maternal Obesity: Team Planning for Delivery and Postpartum Care

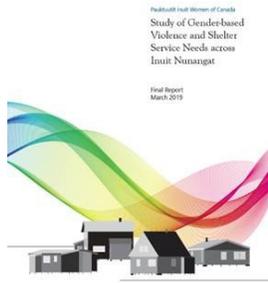

This SOGC guideline is for health care providers (obstetricians, family doctors, midwives, nurses, anaesthesiologists) who provide pregnancy-related care to women with obesity. It reviews key aspects in the pregnancy care of women with obesity and focuses on Team Planning for Delivery and Postpartum Care.

[Access the article.](#)

A Systematic Review and Meta-Analysis of Interventions Incorporating Behaviour Change Techniques to Promote Breastfeeding Among Postpartum Women.

Looking for effectiveness of the Behaviour Change Techniques (BCTs) within interventions trialled internationally after pregnancy to promote exclusive and mixed breastfeeding, a review of the literature was performed. It revealed a moderate significant effect of the interventions promoting exclusive breastfeeding up to four weeks postpartum but this effect slightly declined beyond thirteen weeks. Twenty-nine BCTs were identified within interventions. 'Credible source' and 'instruction on how to perform the behaviour' were the most prevalent. 'Social support (unspecified)' contributed to the effectiveness of exclusive breastfeeding interventions five to eight weeks postpartum.

Study of Gender-based Violence and Shelter Service Needs across Inuit Nunangat

The Study of Gender-based Violence and Shelter Service Needs across Inuit Nunangat was conducted to increase understanding of the factors affecting Inuit women's experiences of violence. The study explores the determinants of gender-based violence in Inuit communities and identifies service gaps to improve the effectiveness of actions that aim to address the needs of Inuit women experiencing violence.

Parental Alcohol Consumption and the Risk of Congenital Heart Diseases in Offspring: An Updated Systematic Review and Meta-Analysis

To provide updated evidence to assess the association between parental alcohol consumption and the risk of total congenital heart diseases (CHDs) and specific CHD phenotypes in offspring, and explore the possible dose–response pattern, authors performed a literature review. Although the role of potential bias and evidence of heterogeneity should be carefully evaluated, this review indicates that parental alcohol exposures are significantly associated with the risk of CHDs in offspring, which highlights the necessity of improving health awareness to prevent alcohol exposure during preconception and conception periods.

Opioid Prescribing in Canada
How Are Practices Changing?

Opioid Prescribing in Canada : How Are Practices Changing?

Opioid prescribing practices are changing across Canada. Fewer people are starting opioid prescriptions and using opioids long term. This report from the [Canadian Institute for Health Information](#) presents trends in opioid prescribing in Ontario, Manitoba, Saskatchewan and British Columbia from 2013 to 2018 and discusses findings within the context of initiatives and guidelines aimed at reducing harms associated with prescription opioid use

[Read the report.](#)

Screening and Referral Practices for Autism Spectrum Disorder in Primary Pediatric Care

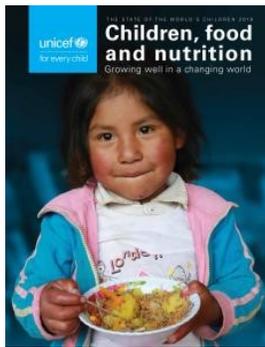

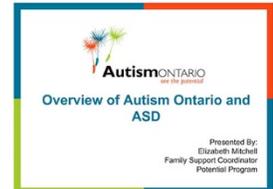

To examine screening practices for autism spectrum disorder (ASD), subsequent referrals, and diagnostic

outcomes within a large network of primary pediatric care practices, rates of ASD screening at 18- and 24-month well-child visits were examined among 290 primary care providers within 54 pediatric practices between June 2014 and June 2016. The study revealed that the vast majority were screened for autism at ages 18 and 24 months as recommended by the American Academy of Pediatrics. However, in cases where children were flagged by the screening test, just 31 percent of providers made a referral to an autism specialist.

[Access the article](#) and [read the discussion](#).

Speaking of which...

The webinar [Supporting Families with a Child with Autism Spectrum Disorder](#) provided service providers with insight into understanding, support and referral of children 0-6 with an Autism Spectrum Disorder. It provided them with practical suggestions in supporting parents who have a child with Autism Spectrum Disorder. Watch the recording today!

The State of the World's Children 2019

For the first time in 20 years, UNICEF's flagship report examines the issue of children, food and nutrition, providing a fresh perspective on a rapidly evolving challenge. Despite progress in the past two decades, one third of children under age 5 are malnourished – stunted, wasted or overweight – while two thirds are at risk of malnutrition and hidden hunger because of the poor quality of their diets. At the center of this challenge is a broken food system that fails to provide children with the diets they need to grow healthy.

What's in my Baby's Food?

A recent, national investigation finds 95 percent of baby foods tested contain toxic chemicals that lower babies' IQ, including arsenic and lead. 1 in 4 baby foods contained all 4 toxic heavy metals tested in this study. The resulting report includes safer choices for parents, manufacturers and retailers seeking healthy foods for infants.

Introducing solid foods?

The booklet [Feeding Your Baby](#), for parents, provides information about feeding their baby from six months to one year. Shaped like a wall calendar, it answers questions they may have about breastfeeding and starting solid foods.

Maternal Mental Health in Assisted and Natural Conception: A Prospective Cohort Study

To compare the pregnancy and postpartum self-reported mood and mental health status of women who conceived with assisted reproductive technology (ART) with those of women who conceived spontaneously, 1176 pregnant women from prenatal clinics in the Ontario Birth Study were enrolled. Women who conceived using ART reported decreased rates of depressive symptoms, perceived stress, and generalized anxiety during the second trimester of pregnancy compared with women who had spontaneously conceived pregnancies, and both groups experienced similar mental health status earlier in gestation and in the postpartum period.

[Access the article.](#)

Speaking of preconception...

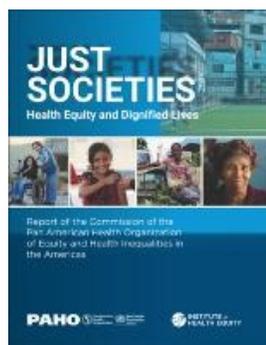

Visit and refer future parents to the bilingual website HealthBeforePregnancy.ca for information to help plan for the healthiest baby possible.

The Quality of Information on Combined Oral Contraceptives Available on the Internet

To evaluate the quality of online information on Combined oral contraceptives (COC), a quantitative content analysis was completed on websites containing patient health information on COCs. Most websites mentioned contraceptive benefit (81.3%), and half reported the typical effectiveness of COCs (53.1%). Commonly included non-contraceptive benefits were alleviation of dysmenorrhea (87.5%) and reduced blood loss (84.4%). Risk of venous thromboembolism was listed in 81.3% of websites, including stroke (56.3%) and myocardial infarction (46.9%); however, sites failed to include details with these risks. Only 46.9% provided information on starting COC; the first-day start method was the most common (40.6%). Nearly half lacked details on managing missed pills (46.9%).

IV. Upcoming Events

Cultural Awareness Training Sessions

Offered by [Nogjiwanong Friendship Centre](#) in Peterborough, the CAT (Cultural Awareness Training) sessions are meant to provide an awareness about Indigenous people in Canada. Participants will have the opportunity to increase their knowledge, skills of the history, experiences, and events which have influenced the relationship of Indigenous people in Canada. The Indigenous population in Canada is the fastest growing population, the youngest, but also the most overrepresented population in the justice and child welfare systems. The goal of this workshop is to develop a knowledge base on Indigenous lived experiences and be able to support those individuals who are seeking your help and/or support. Many dates are offered **until March 31, 2020**.

CCDI Webinar: Unconscious bias

The term "unconscious bias" has become one of those phrases that people use liberally, but what does it really mean? The reality is that we all have bias – forces that shape our opinions and beliefs, which then in turn inform our behaviour, particularly as it relates to valuing diversity. So, what can you do about it? On **November 5th**, this webinar will examine how our perceptions of others are formulated, the

entrenchment of bias that may be unconscious and its impact, and finally, how to enhance awareness and reduce the potential for disrespect that bias can engender.

[Learn more.](#)

OMSSA Webinar: Motivational Interviewing

Motivational interviewing is a counselling method that helps people resolve ambivalent feelings and uncertainties to find the internal motivation they need to change their behavior. It is a practical, empathetic, and short-term process that takes into consideration how difficult it is to make life changes. Learn more from [the Ontario Municipal Social Services Association \(OMSSA\)](#) on **November 6, 2019** at 12:30pm.

V. Resources

Online Course : Understanding Trauma

An online training program is aiming to educate health-care professionals about biases Indigenous women may experience as highlighted by allegations of recent coerced sterilizations. The program incorporates feedback from 11 Indigenous women's organizations from across Canada, and was led by a research team of mostly Indigenous women. The program includes information on traditional healing and Indigenous history such as residential schools and the '60s Scoop.

[Learn more.](#)

Risk-Benefit Assessment for Outdoor Play : A Canadian Toolkit

This toolkit supports practitioners who encourage children's outdoor play. It takes a balanced approach to risk and safety. The toolkit was created because of growing concerns that children are overprotected when playing outdoors or stopped from going outside altogether. As a result, they miss out on the joy and sense of adventure they should have from playing outside, and lose out on the long-term benefits of outdoor play.
